

Instruction document for using this Telegram Bot

1. Install necessary libraries. You can run this command in your project directory terminal:
`pip install -r requirements.txt`
2. Create a file called “.env” . Write your telegram bot token there using this format:
`BOT_TOKEN="YOUR_TOKEN_Here"`
3. You can see a csv file named dataset.csv , you can add or edit conversations here. Also you can add a fresh new dataset file in this project. But the file name should be dataset.csv
4. Now run data_processing.py file in order to train the bot. You have to run this file every time after you can make changes to the dataset. But if there are no new changes in the dataset, you don't need to run this file more than one time.
5. To start the telegram bot, run telegram_bot.py file. The application will start running in the background, and you can chat with the bot in the telegram.
